Compounds. In its compounds boron shows an oxidation state of +3. The first three ionization energies of boron, however, are much too high to allow formation of compounds containing the B³⁺ ion; thus, in all its compounds boron is covalently bonded. That is, one of boron's 2 s electrons is promoted to a 2 p orbital, giving the outer electron configuration 2 s¹ 2 p²; the s and p orbitals can then be mixed to give sp² and sp³ hybrids, which allow boron to be three- and four-coordinated, ...

Boron is a compound that occurs in nature. It is often found combined with other substances to form compounds called borates. Common borate compounds include boric acid, salts of borates, and boron oxide. Several companies in the United States produce most of the world's borates by processing boron compounds.

Boranes are chemical compounds of boron and hydrogen, with the generic formula of B_xH_y. These compounds do not occur in nature. Many of the boranes readily oxidise on contact with air, some violently. The parent member BH₃ is called borane, but it is known only in the gaseous state, and dimerises to form diborane, B₂H₆. The larger boranes all consist of boron clusters that are polyhedral, some of which exist as isomers.

Boron occurs combined as borax, kernite, and tincalconite (hydrated sodium borates), the major commercial boron minerals, especially concentrated in the arid regions of California, and as widely dispersed minerals such as colemanite, ulexite, and tourmaline. Sassolite—natural boric acid—occurs especially in Italy.

The element boron (B, atomic number 5) is found in deposits in the earth's crust at a concentration of about 0.001% (10 ppm). Seawater contains an average of 4.6 ppm boron, ranging from 0.5 to 9.6 ppm. Boron content in fresh water ranges from less than 0.01 to 1.5 ppm, with higher concentrations in regions of high soil boron levels.

Boron compounds that are directly bonded to sp² or sp³ carbons are shifted to higher field due to a pi-interaction between the two p-orbitals on the adjacent carbon and boron atoms. Steric effects are also very important, especially in the case of weaker pi-donors.
